

Multi-Level Protection

Your Business Lifeline...

The Telekenex Multi-Level Protection (MLP) solution ensures connectivity with high availability and dynamic failover protection for organizations with multiple offices. We understand that broadband connection for your remote offices is business critical in the event of network outage. With Telekenex MLP, we offer multiple levels of network outage protection using our tunneling technology for automatic VPN failover and failback.

Designed to sit between your LAN and the Internet cloud, Telekenex MLP utilizes the deployment of the FortiGate-50B appliance which offers complete security, high performance and dynamic failover. You may choose to provide your own VPN broadband connection for each site or Telekenex can provide the connection in the event the private connection was to fail.

Telekenex MLP delivers a comprehensive redundant solution. If the primary connection fails in any of the remote sites, MLP automatically routes traffic sequentially to one of the three VPN paths located in our geographically dispersed POPs.

The fourth VPN path utilizes an independent connection that will route traffic directly from the Internet to your corporate headquarters. With four paths of failover protection, remote users will stay connected in the event of a network outage.
