

# MPLS

Optimize your network performance and protect your business with Telekenex MPLS, a completely private, highly efficient and cost-effective network communications solution.

Telekenex MPLS allows businesses to establish a secure and reliable communications connection between all locations. This robust connection can support all voice and data traffic, including critical business applications set at different priorities and class of service parameters.

## With Telekenex MPLS, you get:

- ✓ A customized private and secure communications connection with specific Class of Service and bandwidth requirement for each location.
- ✓ Intelligent routing with any-to-any for all locations so applications can be optimized with the most efficient path.
- ✓ Optimization on network performance by eliminating firewalls, encryption and tunnels.
- ✓ Cost savings by eliminating unnecessary hardware or administrative overhead.
- ✓ Real time network monitoring and reporting with proactive status notification.
- ✓ Competitive Service Level Agreements (SLAs).

## The Differentiators:

### Nationwide Private Network

Telekenex has its own nationwide private fiber-based network which can securely handle all your voice and data needs. With our extensive footprint and multi-homed peering relationships, we are able to provide the most direct and shortest path to achieve the fastest speed.

### MPLSi (with Internet)

Add Internet access to the MPLS cloud for a comprehensive and cost effective private and public network solution. We can customize each location with specific bandwidth requirements.

### Self Healing Network

With our any-to-any option, your business will always be up and running. By design, redundancy is automatically built in and the network will “heal” itself via an alternate path routing if the primary route is not available.
